                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 50;
                                                                                                                                                                                              Sequence 343, Application US/08123936
Patent No. 5726014
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Educards, Cynthia A.
APPLICANT: Andrews, Beth M.
APPLICANT: Andrews, Beth M.
TITLE OF INVENTION: Screening Assay for the Detection of TITLE OF INVENTION: DNA-Binding Molecules
NUMBER OF SEQUENCES: 640
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Indels
                                      Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human gene for fibrinogen gamma chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SOFTWARE: Patentin Release #1.0, Version #1.25

POLYMOTPHIC bovine DNA markers - used in genetic identification, prolymorphic bovine DNA markers - used in genetic identification, grapher 7; Page 335; 517pp; English.

Table 7; Page 335; 517pp; English.

The sequence is that downstream of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between cobtd. by screening a library of bovine Mbol DNA fragments of between 25 on and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe.

Cone out of 50 clones cross hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, color. The sequence information for ca. 230 such bovine microsatellites in the bovine and indexed herein (see below).

Color The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro and information of the corresp. microsatellite (using the program camplification of the ocrasp microsatellite (using the program camplification of the ocrasp microsatellite (using the program camplification of the ocrasp microsatellite (using the program camplification of the determinism of economic trait closi, or genes involved the determinism of economically important canting the program color, or genes involved the determinism of economically important
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Oligonucleotides 73745:-65 are derived from the newly isolated sequence of the lagA and lagB sequences from Salmonella enterica ssp. enterica serovar typhi. The lagA and lagB sequences (737466) encode proteins which are involved in the invasion of cultured Hela cells by S. enterica. This probe can be used to detect bacteria from S. enterica or S. bongori groups I-VI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The primers V59207-V52209 were used in the production of an altered vertebrate telomere repeat binding protein (A-TRF) which has a telomere repeat binding factor (TRF) dimerisation domain, and forms a hetero-dimer with TRF, preventing it from binding to the specified repeat sequence.

A-TRF, preventing it from binding to the specified repeat sequence. Shortening of telomeres associated with ageing (for cosmetic purposes) and disease, e.g. ataxia telangeictasia, Down's syndrome, atrophy of the skin, age-related macular degeneration, atherosclerosis, tumours and viral (including human immune deficiency virus) infection. Cells expressing A-TRF also have an increased life span in vitro, e.g. for expression of recombinant proteins or where intended for subsequent transplant or for testing, eliminating the need for transformation.

                 Example V; Page 57; 105pp; French.
The primers T70893-4 are used to amplify the sequence encoding the secretion signal peptide of the sporamine A gene from sweet potato tubers. The signal peptide sequence is fused to the first codon of the haemoglobin alpha-chain coding sequence. The recombinant construct is then used for secretion of the haemoglobin from plant cells. The new trecombinant haemoglobin molecules are useful where improved oxygen transport in the blood is needed, e.g. acute or chronic haemorrhage; shock; angioplasty; preservation of organs intended for transplant; treatment of solid tumours (sensitisation to gamma-rays) and malignant

The primers Q89865-Q889470 are PCR primers used in the construction of a new Not1 marker ladder. Each primer consists of a spacer sequence, an area of annealing DNA, and one or more restriction sites. The spacing

Disclosure; Page 9; Ilpp; Japanese.

PCR primers V1679-193 are derived from a known natural human alanine mainotransferase (hALT). The specification describes a mutant hALT in which at least 5 amino acids at the N-terminus are deleted. The mutant enzyme retains hALT activity. The mutant hALT can be used to identify individuals carrying the mutant form and to investigate the consequences of carrying this mutation.

disease; autoimmune polyendocrinopathy candidiasis ectodermal dystrophy;
APECED; autoimmune polyglandular syndrome type I; APS I; PCR primer; ss.
of the priming sites and the restriction sites is such that when the three PCR products are annealed together to form a circular molecule, the resulting 3500bp plasmids can be cleaved with North to give three fragments of 2000, 1000 and 500bp. The marker ladder is useful as a standard for determining the mass of nucleic acid molecules during gel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Autoimune regulator 1 (AIRI) DNA sequence
Example 1; Page 12; 59pp; English.

Example 1; Page 12; 59pp; English.

Per primers X2699-47 were used to amplify fragments of the autoimmune polyendocrinopathy candidiasis ectodermal dystrophy (APECED) (also known as autoimmune polyglandular syndrome type I (APE I)) gene. The specification describes autoimmune regulator proteins (AIR-1, AIR-2, and AIR-3). The AIR polypeptides and polynucleotides can be used in methods for the diagnosis and treatment of diseases related to immune maturation and regulation of immune response towards self and nonself. They can be used particularly in the diagnosis and treatment 23 BP; 6 A; 6 C; 6 T;
                                                                                                                                                                                                                                                                                                                            .;

Claim 1: Page 2072; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the Staureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against Staureus infection. The polypeptides can also be used in a fit for the immunodetection of solypeptides can also be used in a fit for the immunodetection of saureus in a sample. Staureus is implicated in numerous human diseases, including cellulitis, eyelid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences can be used their fragments) are useful as primers or probes for isolating committer readable medium.
                                                                                                                                                                                                                 Staphylococcus aureus contig SEQ ID #1833.

Example 1; Column 21: 38pp; German.

Primers and oligonucleotides (085473-80) used to construct a novel
Chimeric vaccinia virus containing a promoter functionally coupled to a
sequence encoding a region of hepatitis B virus including the presi-B- or
T-cell epitopes but lacking the myristoylation site of the pre S1 region.
The virus may also contain a sequence for an immunopotentiating peptide
such as the CRM228 fragment A (diphtheria toxin cross-reactive material).
The primers (Q85477-8) were used to amplify the sequence encoding the
Corynebacteriphage beta-toxin 228 fragment A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure, Page 23; 118pp; English.

The present sequence represents a BH3 interacting domain death agonist (BID) polynucleotide fragment given in the present invention. The protein, the DNA encoding it or antisense sequences can be used for preventing or treating a decreased apoptotic state of a cell. The decreased apoptotic state that is treated results from a disease such as cancer, viral infections, lymphoproliferative conditions, arthritis, inflammation and autoimmune diseases. Antibodies against the BID protein can be used for detecting a BID polypeptide in a cell or population of cell. The nucleic acid sequence and the BID protein can also be used for cell. The form of the BID protein can also be used for detecting a BID protein can also be used for cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         treating immunodeficiency disease (including AIDS), senescence, neurodegenerative disease, ischemic and reperfusion cell death, infertility and wound-healing. Primers derived from the nucleic acid encoding the BID protein can be used for detecting/quantitating the protein and for detecting alterations in the nucleic acid encoding the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

PT Recombinant antibodies including old World monkey portion and human portion - used for treatment of auto-immune diseases, human portion - used for treatment of auto-immune diseases, also, tumours, disbetes, proliferative infectious diseases, intestinal inflammations and allergies, etc.

PT diseases, intestinal inflammations and allergies, etc.

Disclosure; Fig 7aA; 92pp; English.

The sequences given in Gis505-10 represent sense primers which were used to amplify the human or monkey heavy chain early leader sequence. These primers bind to the first 23 bases of framework region 1 and cincoporate a Sall site in the amplified product. The amplified constant region and an antigen (Ap) binding portion of an old world monkey is variable region, where the old world monkeys may be the same or different. The recombinant antibody may be used as a therapeutic agent for the treatment of rheumatoid arthritis, eczema and immunological disorders.

/note="Inverse PCR was performed on Drosophila
melanogaster strains each of which contains a single EP
transposable element insertion. (The generation of these
insertion strains is described in Rorth P, Szabo K, Balley
A, Laverty T, Rehm J, Rubin GM, Weigmann K, Milan M, Banes
V, Ansorge W, Cohen SM. 1998. Systematic gain-of-function
genetics in Drosophila. Development 6.1049-1057.) The
resultant fragment for each strain was directly sequenced
to determine the genomic sequence at the site of
insertion. Details of the protocols used can be found at
http://fruitfly.berkeley.edu/p_disrupt/inverse_por.html."

                                                                                                                                                                                                             double-stranded CDNA was size selected, ligated to Eco RI adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT773 vector (Pharmacia). Library of a modified pT773 vector (Pharmacia). Library went through one round of normalization to a Cot = 53. Library constructed by Bento Soares and M.Fatima Bonaldo. The adult brain RNA was provided by Dr. Donald H. Gilden. Tissue was acquired 17-18 hours after death which occurred in consequence of a ruptured aortic aneurysm. RNA was prepared from a pool of tissues representing the following areas of the brain: frontal, parietal, temporal and occipital cortex from the left and right hemispheres, subcortical white matter, basal ganglia, thalamus, cerebellum, midbrain, pons and medulia.

Human Gene Signature, 3'-directed cDNA sequence. We are not
submitting the same cDNA sequence redundantly to DDBJ since 1993.
For the abundance information of clones with this sequence in this
library and as well as in other 3'-directed libraries, see '
http://www.imcb.osaka-u.ac.jp/bodymap'. The sequences of the clones
represented by this GS sequences is also found there.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The sequence of Homo sapiens clone
Unpublished
   Center project name: H_NH0189D22.

* NOTE: This is a 'working draft' sequence. It currently consists of 47 contigs. The true order of the pieces to not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as "trus of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Submitted (01-SEP-1999) Genoscope - Centre National de Sequencage :
CP 5706 91067 EVRY cedex - FRANCE (E-mail : seqref@genoscope.cns.fr
- Web : www.genoscope.cns.fr)
The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant.
The library was produced in an oriented direction, in the pBSII

The promoter sequence is useful to construct vectors inducible by cytokines, and bacterial LPS, or other agents found to induce expression of ELAMS in endothelial cells. Such vectors may be useful in gene transfer assays wherein the inducible promoter is positioned so that it drives transcription of a reporter gene such as

   Periodacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylori polypeptide(s) - useful for vaccines to treat or prevent H. pylori Infection, and to detect Helicobacter claim 1; Page 278; 1481pp; English.

This sequence encodes a H. pylori flagella-associated protein.

The protein may be used in a vaccine to prevent or treat H. pylori flagella-associated protein.

The protein may be used in a vaccine to prevent or treat H. pylori the cycle activators or inhibitors.

The genomic sequence of H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contiggs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be production, e.g. in E. coll hosts.

Claim 10; Pages 31-36; 63pp; Japanese.

The present sequence encodes a converting enzyme, which converts the 4-methylene gp. of a beta-ionone cpd. into a keto gp. .

Microbial host cells (pref. E. coli) transformed with a recombinant vector contg. the cDNA, can be used for the produc of astaxanthin, 4-ketozeaxanthin, canthaxanthin, echinenone and other ketocarotenoids. The cDNA was isolated from a cDNA expression library obtd. from Haematcoccus pluvialis NIES-144, in which astaxanthin blosynthesis was induced by 45 mM acetic acid in the culture medium.

  ö
double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA. CDNA on mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-dirented from POLY(T) as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAS hybridise with specific mRNAS. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.
   fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the fragments of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical compositions and vaccines for S. pneumoniae.

FEATURES

```
NOTE: This is a 'working draft' sequence. It currently consists of 41 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Direct Submission

Lounitted (24-FEB-1999) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St. Louis, MO 63108, USA

on Mar 1, 1999 this sequence version replaced gi:4263456.

* NOTE: This is a "working draft" sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as truns of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will

* be preserved.

Details of M. tuberculosis sequencing at the Sanger Centre are available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markow Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C. CANTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg. gtg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon. If this cannot be identified we choose the most upstream initiation codon.
  tuberculosis sequencing and mapping teams, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 15A Unite de Genetique Moleculaire Bacterienne, Institut Pasteur, 28 rue du Docteur Roux, 75724 Paris Cedex 15, France E-mall: parkhill@sanger.ac.uk On Jun 20, 1998 this sequence version replaced g1:2143309.

  Professioning the present invention describes a computer readable medium which has the present invention describes a computer readable medium which has the present invention describes a computer readable medium which has conclective sequences SEO ID No:1 to 391 (V22134 to V5524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID No: 1 to 391. The nucleotide sequences depicted in SEQ ID No: 1 to 391. The nucleotide sequences depicted in SEQ ID No: 1 to 391 where the presents from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S. pneumoniae CC prome (SEQ ID No: 1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a process comprising: (a) screening a genomic DNA library using as a cc probe a target sequence defined by any of the sequences in SEQ ID No: 1 that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating men organism, amplifying nucleic acid molecules whose nucleotide from an organism, amplifying nucleic acid molecules whose nucleotide cragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the CS. pneumoniae genome. Products from the present convention can be used in diagnosis kits and assays, and pharmaceutical commoniations and pharmaceutical menumonians.

```

```
This sequence represents one of 519 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The colypeptides can also be used in a kitt for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, evelid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for an example.

Fright Walley injury-associated molecule, KIM, polypeptides - upregulated in injured or regenerating tissues, useful to promote tissue growth and regenerating, especially to treat renal conditions

Claim 9; Page 13-135; 213pp; English.

Claim 9; Page 13-135; 213pp; English.

Claim 9; Page 13-135; 213pp; English.

The present sequence represents a kidney injury associated molecule (KIM) cDNA clone. KIM proteins can be administered therapeutically by expressing KIM encoding polynucleotides, to promote growth and/or survival of damaged tissue (e.g. renal tissue), since the KIM proteins care upregulated in injured or regenerating (especially renal) tissues.

KIM fusion proteins, conjugates, antibodies and vectors can also be used therapeutically, e.g. these or the KIM proteins may be included with an acceptable carrier in pharmaceutical compositions, useful for therapy/ proteins, especially renal diseases or impairments of renal function in humans (e.g. acute renal failure, acute nephritis). The proteins, especially renal diseases or impairments of renal internalised into cells, can disrupt expression of a cellular KIM gene, also useful in therapy (e.g. to block the growth of tumours dependent on the for growth) or compositions. The proteins and polynucleotides are useful diagnostically e.g. to detect and quantify renal injury disease (indicative of increased risk, or presence of, renal injury or impaired function), or abnormal responses to tissue injury (indicative of increased risk, or presence of, renal lijury or impaired tissue growth arising from/affecting renal tissue). The proteins can also be used to locate KIM-producing calls (especially specific loci, e.g. tissue masses abnormal tissue). By contacting cells with an insight from/affecting renal imageable KIM-binding reagent and imaging reagent accumulation.

Claim 1; Page 827-829; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences
of the invention. The DNA sequences are recorded on a computer readable
medium, preferably selected from a floppy or hard disk, random access
memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using
the S.aureus DNA sequences allows putative functions to be assigned so
that protein-encoding or regulatory regions of commercial, therapeutic or
industrial importance can be obtained. Specifically, sequences which are
likely to encode antigens have been identified and these polypeptides can
be used in a vaccine composition against S.aureus infection. The
polypeptides can also be used in a kit for the immunodetection of
S.aureus in a sample. S.aureus is implicated in numerous human diseases,
including cellulitis, eyelid infections, scalded skin syndrome, toxic shock
syndrome, etc. Organisms transformed with the DNA sequences
of for recombinant production of the polypeptides. The new DNA sequences
commences and the samples are useful as primers or probes for isolating
commenced and the companies of the S.aureus DNA sequences contained on the

BY ADA CONSTRUCTS Which modify expression of senescence-related genes - useful to accelerate or inhibit senescence in crop plants

Claim 16; Page 55-56; 78p; English.

The sequences given in T3509-133 are senescence related genes and fragments which were used in the construct of the invention which modifies the expression of at least one senescence related gene.

Constructs senescence may be inhibited or accelerated in plants including tomato, lettuce, cabbage, banana, strawberry, wheat, maize, rice rape or soybean. Delayed senescence may receive the improve quality of leafy vegetables, inprove tolerance to disease, drought or other stress. Increase protein content of fruits, improve quality of leafy vegetables, improve tolerance to disease, drought or other stress. Increased senescence—nhanced clone, SEE1, which is also known as clone senescence—nhanced clone, SEE1, which is also known as clone of desiccants on crops. This sequence represents the senescence. SEE1 shows homology to genes for two thiol proteases.

Claim senescence. SEE1 shows homology to genes for two thiol proteases. Coryzain gamma from rice and aleurain from barley. The clone SEE1 may therefore encode a protease. This is supported by the finding that a lock bus from a region which is conserved in a range of thiol proteases. The predicted mainto acid sequence of the protein neoded by SEE1 supersets that the protein is 300 mino acids long with a mol. Wt. of 39 the. There are conserved motifs in the amino acid sequence, a putative site. The predominantly hydrophilic protein sequence suggests that the protein is sequence cluss or suggests that the protein is sequence of the protein sequence suggests that the protein is sequence suggests that the protein is acid sequence site and an Asn active site. The predominantly hydrophilic protein sequence suggests that the protein is sequence suggests that the season sequence suggests that the protein is sequence suggests that the protein sequence suggests that the season sequence and s

The sequence contained an oilgo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. cDNA Library Preparation: M.B. Soares Lab Clone distribution: NCI-GGAP clone distribution information can be found through the NCI-GGAP clone distribution information can be found through the PoLXA-Yes.

polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-EI
library is a subtracted library consisted of a mixture of
library. The UI-R-EO library consisted of a mixture of
individually tagged normalized libraries constructed from
8, 12 and 18-day embryo. The tag is a string of 3-5
nucleotides present between the Not I site and the
oligo-dI track which allows identification of the library
of origin of a clone within the mixture. The subtracted
library (UI-R-EI) was constructed as follows: PCR
amplified cDNA inserts from a pool of UI-R-EO clones from
which 3' ESTS had been derived was used as a driver in a
hybridization with the UI-R-EO library in the form of
single-stranded circles. The remaining single-stranded
circles (subtracted library) was purified by
hydroxyapatite column chromatography, converted to
double-stranded circles and electroporated into BHIOB
bacteria (Life Technologies) to generate the UI-R-EI
library. This procedure has been previously described
land."

Sequencing of Human Chromosome 19
   NOTE: This is a 'working draft' sequence. It currently consists of 124 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will

Direct Submission
Submitted (22-OCT-1999) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA on Dec 17, 1999 this sequence version replaced gi:6094569.
All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)
http://ftp.genome.washington.edu/RM/RepeatMasker.html
   Research
  NOTE: This is a 'working draft' sequence. It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

   Homo sapiens chromosome 1 clone RP11-336F23 map 1, WORKING DRAFT SEQUENCE, 19 unordered pieces.
  Gaps
   NOTE: This is a 'working draft' sequence. It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the
  SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguitties or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguitties. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
   Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.
Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
   Submitted (01-JUL-1999) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Apr 2, 1999 this sequence version replaced gi:4521977.

INFORMATION: http://www.hgsc.bcm.tmc.edu/ or email
  QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.
  STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

/cell_line="b-lymphoblastoid cell line Mann"
/clone_lib="T. Spies HLA Cosmid Library"
/note="Spies, T., Breenahan, M. & Strominger, J.L.: Human major histocompatibility complex contains a minimum of 19 genes between the complement cluster and HLA-B. Proc Natl Acad Sci U S A 86:8955-8, 1989"
  This sequence has been validated by multiple enzyme digestion of the clone. The fingerprint comparison with sequence-predicted fragments is given below.

Small fragments below a variable cutoff (approximately 400-600bp) are not mapped and hence do not appear in the table. There are no significant remaining discrepancies between the experimental and predicted values. Uniquely ordered fragment groups are separated by dashed lines.
l error in 10,000 bp. Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this entry's ASN.1 file.

  Submitted (15-0CT-1999) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA All repeats were identified using RepeatMasker: Smit, A.F.A. 6 Green, P. (1996-1997)
   http://ftp.genome.washington.edu/RM/RepeatMasker.html.
* NOTE: This record contains 72 individual
* sequencing reads that have not been assembled into
  contigg. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will

Karatas, A., Klein, J., Landers, T., Choccky, J., Lieu, C., Locke, K., Macdonald, P., Marquis, N., McEwan, P., McGurk, A., McKernan, K., Maddonald, P., Marquis, N., McEwan, P., McGurk, A., McKernan, K., Meldrim, J., Morrow, J., Norman, C.H., O'Connor, T., O'Donnell, P., Peterson, K., Pierre, M., Pollara, V., Riley, R., Stojanovic, N., Subramanian, A., Talamas, J., Tesfaye, S., Thodore, J., Tirrell, A., Vassiliev, H., Viel, R., Vo, A., Wu, X., Wyman, D., Ye, W.J., Zimmer, A. and Zody, M.

Direct Submission

L. Submitted (10-DEC-1999) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, Ma 02141, USA

On Dec 29, 1999 this sequence version replaced 91:6554552.

All repeats were identified using RepeatWasker:
Smit, A.F.A. & Green, P. (1996-1997)

http://ftp:genome.washington.edu/RW/RepeatMasker:html .----- Genome Center Center: Whitehead Institute/ MIT Center for Genome Research NOTE: This is a 'working draft' sequence. It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved. Center clone name: 17\_18

Sequencing vector: M13; M77815; 100% of reads

   New Msolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases
Claim 1, Page 1721-1722, 2054pp; English.
This sequence represents a polynucleotide of the invention. It was isolated from Helicobacter pylori and encodes a H.pylori GHPO protein. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroducdenal diseases associated with these infections, including acute, chronic, and atrophic gastrits, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for the production of antibodies. The products can also be used for the product and duodenal ulcers.

  The five new urease genes ure E, F, G, H and I were identified by deletion studies in E.coli where all 5 were found to be necessary for functional urease expression. They encode proteins of estimated mol. wt. 19.5, 28.6, 21.7, 29.6 and 21.7kD, respectively. Recombinant H.pylori having a mutation in at least one of the 5 new genes or in ureA or ureB which renders them urease-negative or ureasse-depleted (attenuated strains) can be used as immunogens to brotect against H.pylori infection. 776 G; 1026 T;

  X30724 to X30946 represent genomic DNA sequences isolated from Streptococcus pneumoniae strain 0100993. These genomic DNA sequences concode the novel proteins given in Yilli 4 to Yil367. The proteins, isolated from Streptococcus pneumoniae, can be used in vaccines against streptococcal infections and in assays for identifying compounds that inhibit to activate the activity of the proteins. The antagonists can be used to treat an individual having need to inhibit a bacterial protective immune response in mammals.

   Claim 1, Page 838; 1481pp; English.

The present sequence encodes a H. pylori inner membrane protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified
   and defermined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts. 200 C; 212 G; 317 T; Sequence 1041 BP;

Pricobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori Pricobacter pylori for diagnosis of H. pylori infection

Thiection and for diagnosis of H. pylori infection

Claims 5,6,42; Page 412; 1145pp; English.

Claims 10,100 polypeptide binding compounds, useful as potential H. pylori or to identify the provided from it infection of H. pylori infection or to identify the CC may be used for the identification of H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the complementary to the DNA act as antisense sequences and can be used to prevent the L. pylori mRNA. Antibodies against the protein can be used translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of CC in immunoassays to evaluate from overlapping contigs generated by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted coding regions contalysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli

common to two sexes

Claim 1, Page 9: 19pp; Japanese.

The present invention describes a marker containing a DNA having at least one sequence of X16664 to X16670 or its portion. Also described is a method for identifying or specifying a biosample by using the above marker, and a method for the DNA present the 5 and/or the 3' aloe adjacent to at least one sequence of X16664 to X16670 by using a bove marker, and a method for the DNA present the 3' aloe adjacent to at least one sequence of X16664 to X16670 by using a DNA having part of the sequence as the primer. It can specify or identify a blosample. For example, it can identify a sample to be bovine-derived. It can specify nucleus and cytoplasm, sex chromosome and autosome, X chromosome and Y chromosome, short arm and long arm.

In an example, bovine genomic DNA were isolated from male and female bovine liver. Sheep, swine and captine DNA were isolated. DNA of Seq. Nos. 1-7 were isolated and purified. The bovine male specificity of male bovine-derived DNA was examined.
   Gaps
  The DNA sequences (198944-55 contain a polymorphic protection of the DNA sequences (198944-55 contain a polymorphic portion of the Coding region of domestic fowl's (1.e. chicken, turkey, pheasant) MMC B-G subregion of domestic fowl's (1.e. chicken, turkey, pheasant) R89581). The sequences are used as probes to detect restriction fragment length polymorphism patterns typical of various B-G alleles, e.g. resistance to Marek's (and other) disease, general fitness and productivity, all are related to MKC MAPLOYPE. This haplotypeing method has the advantage of not requiring alloantisera. Sequence 3134 BP; 818 A; 718 C; 777 G; 821 T;

   Louis,
   This sequence was identified as CDM:10211724 by the submitter.

For further information on this sequence e-mail to fly@celera.com.

NOTE: This is a 'working draft' sequence.

This sequence will be replaced
   Direct Submission
Submitted (23-FEB-1999) Genome Sequencing Center, Washington
University School of Medicine, 4444 Forest Park Parkway, St. Loui
MO 63108, USA
* NOTE: This is a 'working draft' sequence. It currently
* consists of 1 contigs. The true order of the pieces
* to not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

Direct Submission
Submitted (25-SEP-1999) Multimegabase Sequencing Center, University of Washington, PO BOX 357730, Seattle, WA 98195, USA
* NOTE: This record contains 192 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that

Submitted (30-JUN-1998) Department of Genetics, Washington University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA SUBMITTED BY:
  attempt has been made to verify whether this corresponds to the full-length of the original mRNA from which it was derived. We have tried to obtain double-stranded, or double chemistry sequence across the entire clone, but potentially, there are areas in the sequence where this level of coverage was not achieved.

Nevertheless, we are confident of the accuracy of this sequence as all regions of low quality, as defined by PHRAP (P. Green, in preparation), were visually inspected and edited accordingly. The consensus quality values for this sequence have been submitted

  BACSPOOFG 449 bp DNA BCT 26-APR-1993
B.subtilis spoof 2 gene coding for early sporulation protein Spoof.
M11081
   Bacteria; Firmicutes; Bacillus/Clostridium group;
Bacillus/Staphylococcus group; Bacillus.
I (bases 1 to 44)
Trach, K.A., Chapman, J.W., Piggot, P.J. and Hoch, J.A.
Deduced product of the stage 0 sporulation gene spoOF shares
monology with the SpoOA, OmpR, and SfrA proteins
Proc. Natl. Acad. Sci. U.S.A. 82, 7260-7264 (1985)
86042645
Draft entry and computer readable sequence in [1] kindly provided
by J.A.Hoch, 23-JAN-1986.
The spoOF locus defined in [1] is different from a previously
sequenced putative spoOF locus (Shimotsu, et al., 1983; see
   G55770 709 bp DNA STS 26-OCT-1999
SHGC-100980 Human Homo saplens STS genomic, sequence tagged site.
G55770
  putative ribosome binding site is present at positions 22-27.

When isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity resting or phenotypic typing for disease

Claim 1: Page 241; 310pp; English.

Claim 1: Page 241; 310pp; English.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in X10269-X12937 are human DNA fragments which have been isolated using the primers represented by the appropriate 10PAC-IUB ambiguity code. These fragments can be used in X09121-X10268. The base occupying the polymorphic site is indicated by the appropriate 10PAC-IUB ambiguity code. These fragments can be used in c.g. forensics, paternity testing or for phenotypic typing for diseases such as agammagiobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, c.g. forensics, paternity alsaeses, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary pherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary cancenthagic telangiectasia, familial colonic polyposis, Bhers-Danlos syndrome, osteogenesis imperfected, acute intermittent porphyria, cutchimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such can slongworkty, appearance (e.g. baldness; obesity), strength, speed, calungs or therapeutic treatments. The isolated polymorphic nucleic acid drugs or therapeutic treatments. The isolated polymorphic or exempted or enchanged and account or enchanged.

  ö
  A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences of given in T19001-T28837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed CDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from thranslated sequence is unique to a particular mRNA species, almost untranslated sequence is unique to a particular mRNA species, almost is constructed so as to reflect accurately the relative abundance of different mRNAs. In the particular tissue from which it was derived. The appearance frequency of a qiven GS in a CDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. 30 G; 36 T;
   Gaps
  Identifying gene signatures in 3'-directed human cDNA library - e.g. for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human

   Wethod for inhibiting apoptosis - using receptor internalisation and degradation (RID) complex

Wethod for inhibiting apoptosis - using receptor internalisation and degradation (RID) complex

Example 10; Fig 28A-XX; 126pp; English.

Example 10; Fig 28A-XX; 126pp; English.

This is the nucleotide sequence of vector 231-10, a human adenovirus serotypes (Ad5) vector. 231-10 lacks the ElA, ElB and ElS transcription units. The deleted ElA and ElB regions are replaced with an expression cassette wherein all the E3 proteins are expressed from the human cytomegalovirus (CWY) promoter. The capture of virus rec700, which is an Ad5-Ad2-Ad recombinant that has the Ad2 version of the E3 genes from virus pm734.1, a derivative of virus rec700, which is an Ad5-Ad2-Ad recombinant that has the Ad2 version of the E3 genes from the E3 genes from the C4 galgenes and H7 K proteins. In addition, the vector has for the tilminate the first 2 Met codons, thereby precluding synthesis of that eliminate the first 2 Met codons, thereby precluding synthesis of functional ADP. Because 231-10 lacks E1A, viral genes in the vector backbone are not expressed; only the E3 proteins are essentially intert vehicle by which E3 genes can be delivered into cells. The invention provides a method for inhibiting apoptosis of a cell expressing a death receptor of the tumour necrosis factor cells. The invention and degradation (RID) protein complex or a composition of adenovirus on a composition of administration to the cell expressing the RID complex or a composition containing the RID complex or a composition containing the RID complex or a composition receptor to receptor and methods as are used to treat the composition and methods are used to treat the composition and methods are used to treat the reaction and methods are used to treat the reaction and methods are used to treat the reaction of degradation of degradation of degradation to degradation and methods are used to treat the reaction and methods as are used to treat the reaction of the compositio

plasmid contg. Oplne synthase gene for selection - and foreign DNA, useful as vector for transforming plant cells
Disclosure: Page 212-217; 69pp; Japanese.

Plant cells (and protoplasts) and plasmids contg. the DNA fragment which includes an opine synthase gene plus a gene for antibitotic resistance are claimed. These plasmids provide max. efficiency for transfer of foreign genes and can be amplified in the plant genome. They do not contain genes specifying tumour formation and will not sepread antibiotic resistance throughout the plant population. Sequence 24593 Bp; 6554 A; 5493 C; 5787 G; 6759 T;

   The secondary screening. The secondary intestinal onco-foetal gene - useful for detecting neoplastic cells, esp. intestinally-originating prim. and metastatic tumours claim 1; Fig 8: 12pp; English.

This sequence represents a novel intestinal oncofoetal gene. A cDNA claim 1; Fig 8: 12pp; English.

This sequence represents a novel intestinal oncofoetal gene. A cDNA claim 2: 12pray was made from ploy(A) + RNA obtd. from IEC-18 rate feocetal intex*stine cells using the lambda gil0 cloning system. 20,000 plaques were transferred onto duplicate nitrocellulose filters.

Diagues were postitive when probed with IEC-18 subtracted cDNA and negative with NEK-52E (ormal rat kidney) cDNA were selected for secondary screening. DNA was prepd. from the 5 plaques and in the secondary screening. DNA was prepd. from the 5 plaques and the cloned inserts isolated. All of them had the same size (2.2kb) and when labelled hybridised with IEC-18 cells and fetal rat intestine. The insert from one lambda gill clone was subsequently cloned into the EcoRI site of pucil3 and named oct-5. 533 G; 568 T; sequence 2220 BP; 588 A; 531 C; 533 G; 568 T;

  plants and their cells
Claim 28; Fig 1: 87pp; English.
The inventors claim a vector contg. a transformation-inducing
principle (TIP) gene from Ti plasmid pTil5955. The sequence of the
T-DNA of the octopine-type Ti plasmid has fourteen open reading
frames bounded by eukaryotic promoters, ribosome binding sites, and
polyadenylation sites. With the vectors, expression of structural
foreign genes in plant cells is promoted. The gene esp. encodes an
insecticidal toxin identical to or derived from the crystal protein
  17-ocr-1991 (first entry)
Complete nucleotide sequence of the T-DNA region of the octopine Ti
plasmid p7115955.
